Gone phishing

Phishing is an attempt to criminally and fraudulently acquire sensitive information, such as usernames, passwords and credit card details, by masquerading as a trustworthy entity in an electronic communication. PayPal, eBay and online banks are common targets. Phishing is typically carried out by email or instant messaging and often directs users to enter details at a website, although phone contact has also been used.

The volume and severity of phishing scams is rocketing as cyber-criminals become ever more cunning and sophisticated.

The online scams attempt to trick unwary surfers into divulging sensitive and confidential information to bogus websites designed to appear as bona fide businesses such as internet banking sites.

These fraudsters have in recent months begun to refine their attack methodologies with the use of automated hacking tools such as botnets that can vastly increase the potency of their campaigns.

HP, Toshiba, Lenovo, Sony or Panasonic Designed by YOU!

We still sell XP PRO machines

At Software To Go, all PC and Notebook Sales are designed for your individual needs.

As always, setup and configuration are included so all you have to do is plug it in and start working!

Software To Go's machines are designed for business performance demands. With competitive prices and nice touches such as two USB ports on the front panel and six on the back, a fast 48X CD-RW and 16X DVD-ROM combo drive, Core 2 Duo processor and XP PRO, these computers have more potential for expansion than seen with lower end consumer level systems. Our business class Microtowers are a great system taking care of your technology needs so you can take care of business.

Starting at \$599, you will get the biggest bang for your buck at Software To Go! Give us a call and move your business forward!

Did you know?

Myspace and a few other websites are playing host to a banner advertisement for DeckOutYourDeck, which apparently loads a Trojan Horse program onto user systems. Millions of visitors to Myspace and other websites have been infected with this spyware said Reston, Va., company iDefense.

iDefense is an Internet security company which is owned by Verisign. iDefense said that the spyware infects unpatched versions of Windows by using a security flaw in Microsoft Internet Explorer.

October 2007

One day after Symantec Corp. researchers discovered software that attacked a critical [unpatched](#) vulnerability in RealNetworks Inc.'s media player, RealNetworks says that a fix for the issue is imminent.

"Real has created a patch for RealPlayer 10.5 and RealPlayer 11 that

addresses the vulnerability identified by Symantec," wrote RealNetworks General Manager of Product Development Russ Ryan, in a Friday blog posting. "Real will make this patch available to users via this blog and our security update page."

Users of RealOne Player, RealOne Player v2, and RealPlayer 10 should upgrade to the 10.5 version of the product or the RealPlayer 11 beta code and should install the patch, Ryan said.

"The exploit itself is embedded in advertisements that were being served by 247realmedia," Symantec said in a note on its DeepSight threat management system. "The redirection to the exploit page... was accomplished through an iFrame embedded in each advertisement."

iFrame is an HTML command that allows developers to insert a second Web page into the page being viewed. It is often used by malware creators because these iFrame pages can be as small as 1 [pixel](#), making them almost invisible to the naked eye.
